

Preform challenges? We have solutions.

PTI's new, all-electric Arburg injection molding machine with Husky's Adapt™ tooling capability can provide a cost-effective solution.

Brand owners, resin suppliers and converters now have an independent/confidential development and production resource for material evaluation, package validation testing (performance, filling line, shipping, etc.) and small test market distribution before committing to a wider launch.

Here's what it means:

- Multi-cavity preform production from valve-gated hot runner
- Ideal for low volume production, large scale prototyping/testing and other applications
- Minimal tooling investment and lead time
- Ability to scale up from one to four cavities as needed
- Quality guarantee: preform IV and other critical aspects
- 10,000 to 100,000 parts...or more
- PET other materials
- Can run other Adapt™ stack molds

Here's how you can benefit:

For brand owners:

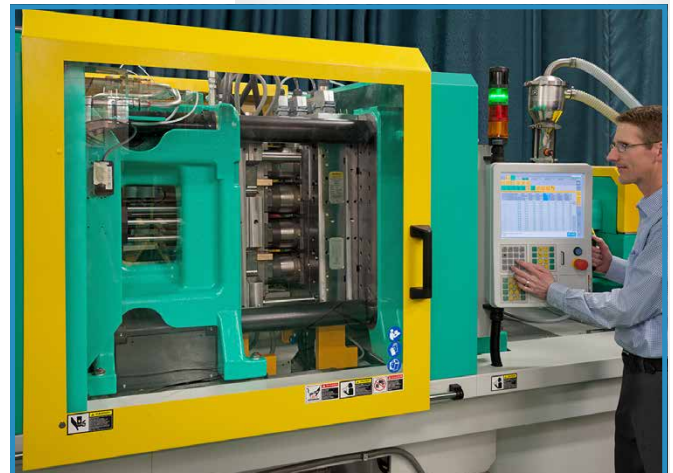

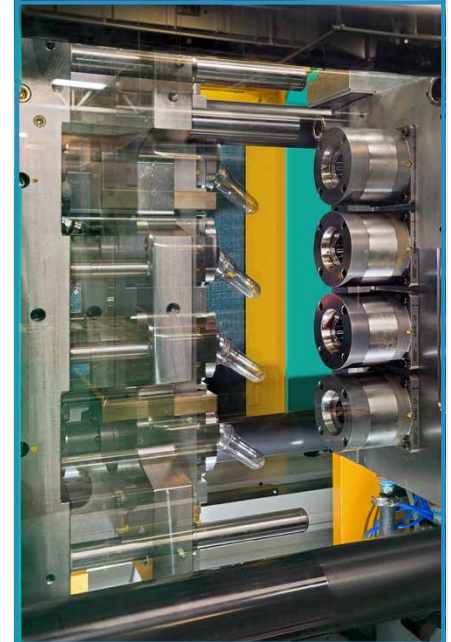

- Lowers cost and reduces timing of low volume production or initial product launch quantities.
- Validates new packaging designs, fill line trials, FATs, market research, with low volume preforms.

For converters:

- Alternate supply source to address capacity challenges
- Cost competitive
- Reduce project and production lead times

For resin suppliers:

- New resin material evaluation
- Cost competitive vs. other small scale options
- Reduce project and production lead times
